An **Associate Data Analyst** was asked

Q. What do you know about the C++ programming language?

Ans. C++ is a general-purpose, **high-performance** programming language that blends **procedural**, **object-oriented**, and **generic** programming paradigms. Originating as an extension of C, it offers fine-grained control over **memory** and **hardware**, deterministic resource management via **RAII**, and a rich standard library (STL) with containers, algorithms and iterators. Modern C++ (C++11/14/17/20/23) adds features like **auto**, **move semantics**, **lambda expressions**, **constexpr**, **template enhancement**...read more

Q. What is Object Oriented Programming and what are its features?

Ans.

- **Definition:** Object Oriented Programming (OOP) is a programming paradigm that models software as interacting **objects**—instances of **classes**—which encapsulate data and behavior to design modular, maintainable systems.
- **Encapsulation:** Objects hide internal state and expose behavior through methods, enforcing **data integrity** and reducing coupling.
- **Abstraction:** Classes provide simplified interfaces that expose only necessary details, allowing developers to work at a higher ...read more

An **Associate Data Analyst** was asked

Q. Describe the purpose of a primary key in a SQL table. Why is it important?

Ans.

- **Definition:** A **primary key** is a column or combination of columns that uniquely identifies each row in a table; it enforces **uniqueness** and **non-nullability** for those fields.
- **Data integrity:** By preventing duplicate or null identifiers, a primary key ensures each record is distinct, which is foundational for reliable data storage and queries.
- **Referential integrity:** Primary keys are the target of **foreign keys**, enabling clear relationships between tables and enforcing consiste...read more

An **Associate Data Analyst** was asked

Q. What is the difference between a Primary Key and a Unique Key?

Ans.

- **Definition: Primary key** is a column or set of columns that uniquely identifies each row in a table; **Unique key** is a constraint that ensures all values in a column or set of columns are distinct.
- **Nullability: Primary key** columns **cannot be NULL**; **Unique key** columns can be NULL (behavior for multiple NULLs depends on the RDBMS).
- **Multiplicity:** A table can have **only one primary key** but **multiple unique keys**.
