A **Data Analyst** was asked
1mo ago

Q. What is the difference between a LEFT JOIN and an INNER JOIN in SQL?

Ans. INNER JOIN returns matching rows from both tables; LEAF is not a SQL join but may refer to data structure nodes.

- INNER JOIN combines rows from two tables where the join condition is met, e.g., SELECT * FROM A INNER JOIN B ON A.id = B.id;
- LEAF typically refers to the ... read more

Q. Which Python libraries are most commonly used for data analysis?

Ans.

- **Pandas:** Primary library for data cleaning, manipulation and tabular operations (groupby, merge, pivot, time-series); I use it for ETL and feature engineering.
- **NumPy:** Core for numerical computing, array operations and performance-critical routines; used alongside Pandas for vectorized calculations.
- **SciPy:** For statistical tests, optimization and signal processing when I need more advanced numerical methods.
- **scikit-learn:** For classical machine learning — preprocessing, fea...read more

Q. What is DDL in DBMS?

Ans. DDL (Data Definition Language) is the subset of SQL used to **define and modify database schema and structures**. Common DDL commands include **CREATE**, **ALTER**, **DROP**, **TRUNCATE**, and **RENAME** — these create or change tables, indexes, views, schemas and constraints (primary key, foreign key, unique, etc.).

DDL statements affect the **metadata** stored in the data dictionary and control the database layout rather than the row-level data (which is handled by DML). DDL operations are typica...read more

Q. What is the SELECT statement in SQL?

Ans. The **SELECT** statement is the primary SQL command used to **retrieve data** from one or more database tables or views. At its simplest form, it specifies **which columns** to return and **which table** to read from: `SELECT column_list FROM table_name;`. It produces a **result set** — a set-based collection of rows matching the query.

Key aspects and common clauses:

- **Projection:** `SELECT col1, col2` picks specific columns; `SELECT *` returns all columns.
- **Filtering:** `WHERE` applies row-level condit...read more

Q. What is DML?

Ans. DML stands for Data Manipulation Language, used to retrieve, insert, update, and delete data in databases.

- DML is a subset of SQL commands focused on managing data within tables.
- Common DML commands include SELECT (retrieve data), INSERT (add new data), UPDATE (modif... read more

Q. Tell us about SQL.

Ans.

- **Definition:** SQL (Structured Query Language) is the standard language to **define, query, modify, and control** data in relational databases using declarative statements like **SELECT, INSERT, UPDATE, DELETE**.
- **Core areas: DDL** (CREATE, ALTER, DROP), **DML** (SELECT, INSERT, UPDATE, DELETE), **DCL** (GRANT, REVOKE) and **TCL** (COMMIT, ROLLBACK).
- **Querying & joins:** Powerful for filtering, aggregation and combining tables via **INNER/LEFT/RIGHT/FULL JOIN**, subqueries and window functions for anal...read more

Q2. What is the difference between a LEFT JOIN and inner joins in SQL?

Ans. LEFT JOIN returns all records from the left table and matched records from the right; INNER JOIN returns only matched records from both tables.

- LEFT JOIN returns all rows from the left table, even if there is no match in the right table; unmatched right table columns will be NULL.
- INNER JOIN returns only rows where there is a match in both tables based on the join condition.
- Example of LEFT JOIN: SELECT * FROM A LEFT JOIN B ON A.id = B.id; returns all A rows plus matching B... read more

Q1. What is ddl

Ans. DDL stands for Data Definition Language, used to define and manage database structures.

- It defines database schemas and structures.
- DDL commands do not manipulate data, only the structure.

Answered by **AI**

Add your answer →

Q2. What is dml

Ans. DML, or Data Manipulation Language, is a subset of SQL used for managing and manipulating data in databases.

- DML includes commands like INSERT, UPDATE, DELETE, and SELECT.
- Example: INSERT INTO employees (name, age) VALUES ('John Doe', 30);
- DML allows users to retrieve and modify data stored in a database.
- Example: UPDATE employees SET age = 31 WHERE name = 'John Doe';
- DML is essential for data analysis and reporting tasks.

Q3. What is select

Ans. SELECT is a SQL command used to query and retrieve data from a database table.

- SELECT retrieves specific columns from a table. Example: SELECT name, age FROM users;
- It can filter results using WHERE clause. Example: SELECT * FROM users WHERE age > 30;
- SELECT can sort results using ORDER BY. Example: SELECT * FROM users ORDER BY name ASC;
- It can aggregate data using functions like COUNT, SUM. Example: SELECT COUNT(*) FROM users;
- SELECT can join multiple tables. Example: SELECT... read more
